Initiative to Improve Mobile Experience

IMDA is always seeking ways to improve consumer mobile experience. IMDA thus launched the IMconnected (previously MyConnection SG) mobile application ("App") in October 2014. The App utilises voluntary crowdsourcing to anonymously gather relevant, non-personal data relating to mobile users' quality of experience. Information collected includes data relating to broadband speed, latency, coverage on 3G and 4G mobile cellular networks and experiences on WiFi networks.

Be a part of the community!

Download the App now!

IMconnected is available on both Apple App Store and Google Play Store.

Share your mobile experience with us and contribute towards a better mobile experience. This will help IMDA better understand mobile broadband performance and take measures to improve mobile service experience for consumers.

Publishing of Results

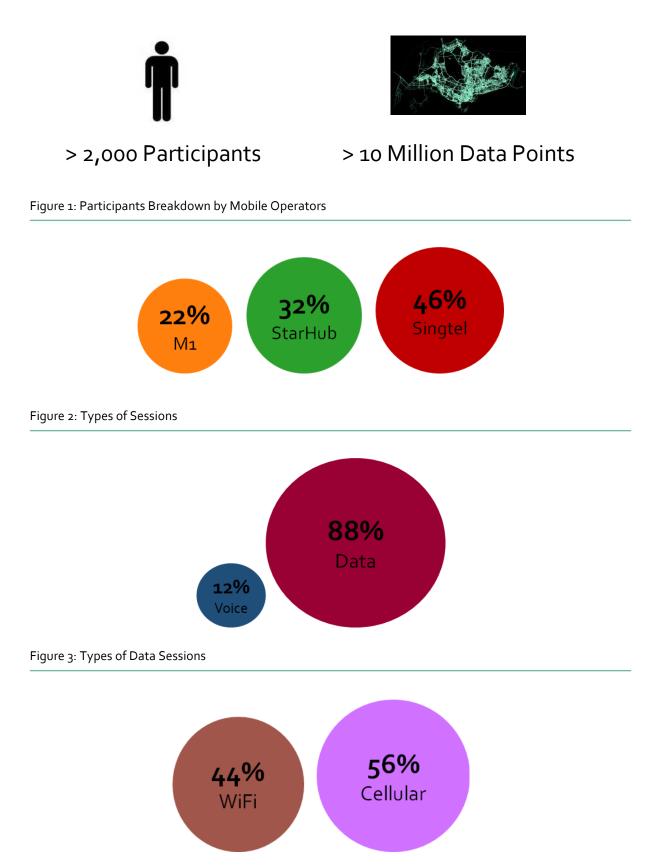

IMDA will publish indicators relating to users' service experiences on the mobile cellular and Wireless@SG networks every 6 months. These indicators include mobile signal strength (mobile coverage experience), throughput (data transmission speed) and latency (time lag).

The survey results reflect the mobile service experience of users at different locations, at different times of the day, and over a 6-month period. The results will allow IMDA to work with mobile operators to enhance the quality of experience for consumers on the mobile networks. IMDA publishes the survey results to facilitate greater information transparency to allow consumers to make informed choices on their mobile broadband plans and encourage mobile operators to improve mobile usage experience for consumers.

Your Contribution to IMconnected

The IMconnected App has garnered more than 2,000 participants, obtaining more than 10 million data points across various parameters for the period July to December 2017.

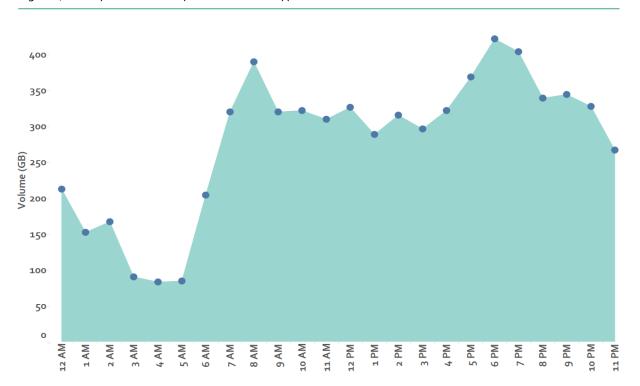

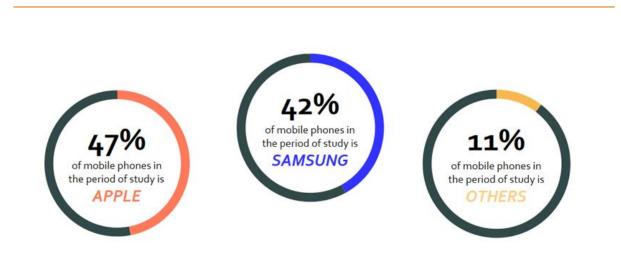

Figure 4: Hourly Data Consumption Pattern of Typical Users

5

Operating Systems and Handset Models

From the data collected during this period, we see a variety of mobile handset models used by participants, with Apple and Samsung handsets being the most popular brands. The Group "Others" consists of mobile phone manufacturers apart from Apple and Samsung.

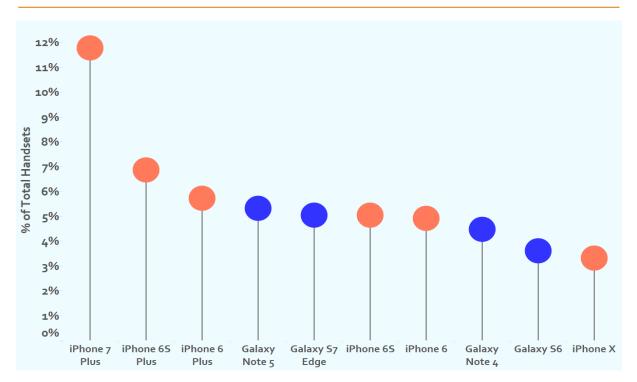

Figure 5: Participants Breakdown by Manufacturers

Distribution of Data Points

IMconnected is able to locate the position of a device with reasonable accuracy where the measurement is taken.

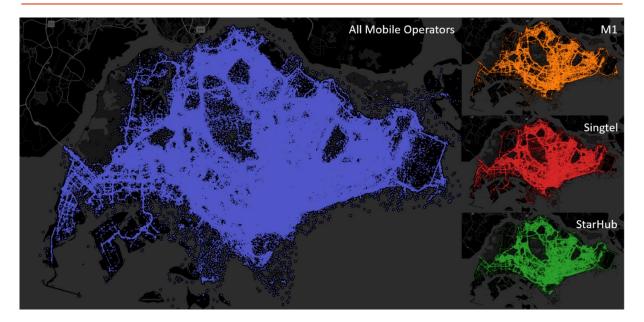

Figure 7: Distribution of Data Points

Data points collected were well distributed across Singapore. Results are representative of the wider public experience.

Mobile Data Usage Experience

Results from IMconnected are reflective of actual consumers' experience. Multiple factors such as consumers' data usage pattern, subscription plans, as well as the models of mobile devices do influence the results of consumer experience.

The assessment of the quality of end users' service experience on the 3G and 4G mobile networks was made from data points taken from the Android operating system. Nevertheless, the results are deemed to be representative of user experience in Singapore.

Mobile Signal Strength

The results show the mobile signal strength or service coverage experience reported on both the 3G and 4G networks. The data is represented in a signal strength heat map, aggregated across all mobile operators.

Figure 8: 4G Signal Strength

Figure 9: 3G Signal Strength ¹

¹ Based on IMDA's data, there is a decrease in the number of 3G subscribers with an accompanying increase in the number of 4G subscribers in this period of report.

Data Download Speed - Throughput

We have provided the data download speed or throughput numbers aggregated across all mobile operators to provide an overall sense of consumers' mobile data usage experience. We have also provided throughput figures for the 10th, 50th, and 90th percentiles as well as the peak attainable speed.

Overall Median Throughput (Across Operators)

The collected measurements show improving 3G and 4G median throughput.

On average, for the period July to December 2017, 50% of our participants experienced a median 4G speed of 42.8 Mbps and 3G speed of 8.9 Mbps.

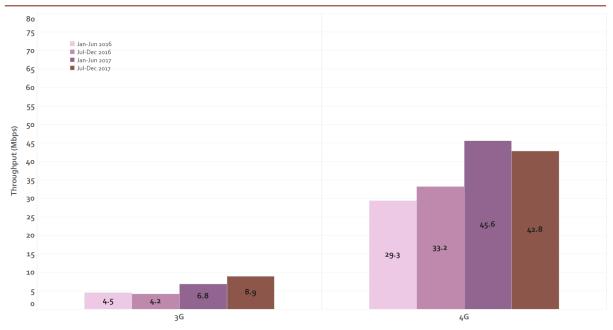

Figure 10: Overall 3G & 4G Median Throughput Graph (Comparison Across Periods)

4G Throughput Indicators

The collected 4G median throughput measurement has increased over time.

Figure 11: 4G Median	Throughput by Operato	rs Table (Figures for Ju	ly 2017 – December 2017)

Jul'17-Dec'17: 4G Median Throughput (Mbps)			
Мı	Singtel	StarHub	
29.5	58.9	29.7	

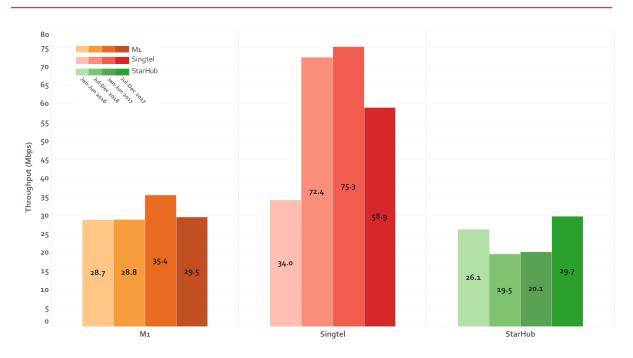

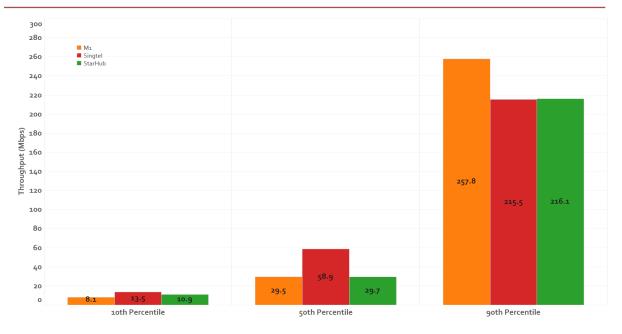

Figure 12: 4G Median Throughput by Operators Graph (Comparison Across Periods)

Jul'17-Dec'17: 4G Throughput (Mbps)				
	10th Percentile	50th Percentile	90th Percentile	
Mı	8.1	29.5	257.8	
Singtel	13.5	58.9	215.5	
StarHub	10.9	29.7	216.1

Jul'17-Dec'17: 3G Median Throughput (Mbps)			
Мı	Singtel	StarHub	
8.o	11.7	9-3	

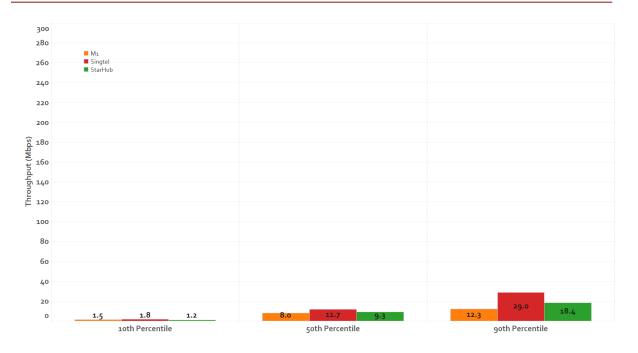

Jul'17-Dec'17: 3G Throughput (Mbps)				
	10th Percentile	50th Percentile	90th Percentile	
Mı	1.5	8.o	12.3	
Singtel	1.8	11.7	29.0	
StarHub	1.2	9-3	18.4	

Figure 17: 3G Throughput Percentiles by Operators Table (Figures for July 2017 – December 2017)

Peak Throughput

Peak speed or throughput is reported as the median of all daily maximum speeds attained over the reporting period of July 2017 – December 2017.

The collected measurements show improving 3G and 4G peak speed.

For the period July to December 2017, our participants experienced an overall 4G peak speed of 262.2 Mbps and 3G peak speed of 28.2 Mbps.

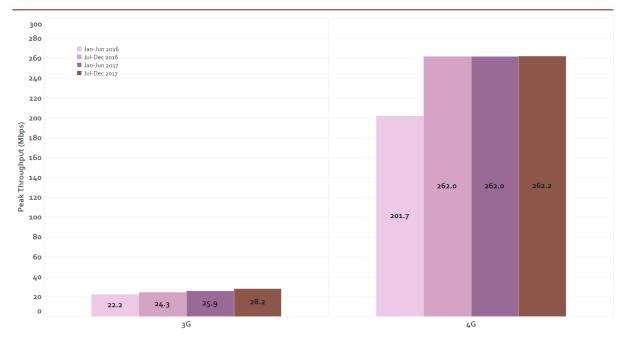

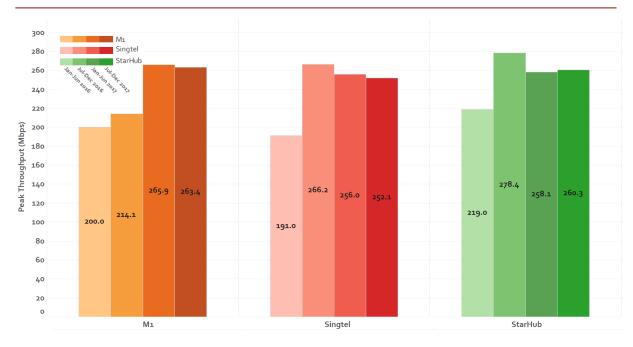

Figure 19: Overall 3G & 4G Peak Throughput Graph (Comparison Across Periods)

The collected 4G peak throughput measurement has increased over time.

Jul'17-Dec'1	Jul'17-Dec'17: 4G Peak Throughput (Mbps)		
Mı	Singtel	StarHub	
263.4	252.1	260.3

Similarly, the collected 3G peak throughput measurement has increased over time.

Jul'17-Dec'17: 3G Peak Throughput (Mbps)		
М1	Singtel	StarHub
17.0	35.6	27.7

Figure 22: 3G Peak Throughput by Operators Table (Figures for July 2017 – December 2017)

Figure 23: 3G Peak Throughput by Operators Graph (Comparison Across Periods)

Latency

Latency is measured in milliseconds and is defined as the time taken for a data packet to travel from one point to another and back. In IMconnected, this is the duration for the data packet to travel from the end users' mobile device to a local server and back (This is the responsiveness of the network, which could also be referred to as time lag).

Overall Latency

The collected measurements show improving 3G and 4G latency.

For the period July to December 2017, our participants experienced an average 4G latency of 47.7 milliseconds and average 3G latency of 71.9 milliseconds.

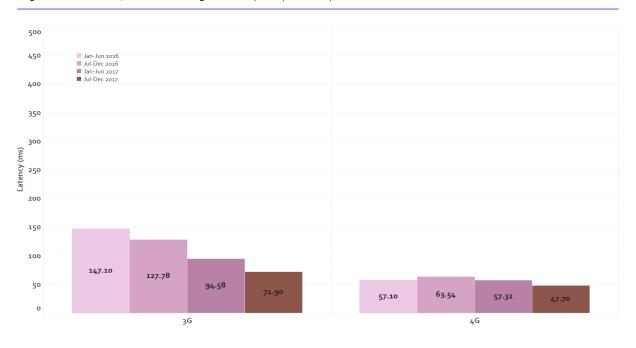

Figure 24: Overall 3G & 4G Average Latency Graph (Comparison Across Periods)

The collected 4G average latency measurement has improved over time.

Figure 25: 4G Average Latency by Operators Table (Figures for July 2017 – December 2017)

Jul'16-Dec'17: 4G Average Latency (ms)			
Mı	Singtel	StarHub	
44.0	47.8	51.3	

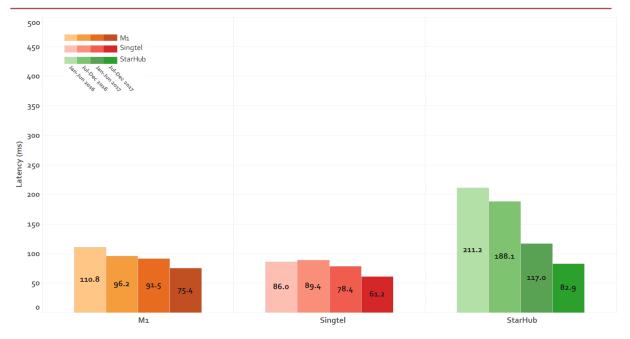

Similarly, the collected 3G average latency measurement has improved over time.

75-4	61.2	82.9	

What is Wireless@SG?

Wireless@SG is part of IMDA's initiatives to facilitate the provision of free and seamless wireless broadband services in public places.

Wireless@SG Experience

Wireless@SG users may experience faster access speeds due to operators and venue owners providing higher capacity or higher speed fixed-line or backhaul connectivity at each WiFi access point. Users can enjoy a better surfing experience as a result.
