

Comments to Guidelines for the Provisioning of Coaxial Cable Home Networking  
Solutions

1. Section 2.2.1 - The second configuration (filter by the splitter input) is preferred over 1<sup>st</sup> one (filter by tap) – If there is a long coax from tap to splitter input it may create high out-out isolation between CCHN modems.
2. Sections 2.2.2 to 2.2.4 - houses with multiple drops from the Tap can be installed by adding isolation filter on all the drops at the tap side and adding CCHN band-pass filter on the home splitter side.
